Proposal of the site:

The site will contain different pages for different types of problems to be solved by the crowd. Their responses will be saved in databases designed accordingly.

The site will follow the format of slides where new questions will be loaded dynamically from a database based on the responses of demographics survey.

The demographics survey will be taken prior to the start of survey. The questions for each user can be varied based on the demographics survey.

The site can be developed in PHP with good UI where scores will be given based on number of questions answered by the surveyor. The set of questions will also contain some basic obvious questions hidden in large text to remove the responses of users answering randomly.
